

## To inform, educate and entertain.

IcelnSpace was formed as a community website for amateur astronomers in Australia and New Zealand. It has grown to be the largest and most active amateur astronomy community in the Southern Hemisphere.

We have played a significant role in the advancement of amateur astronomy in our region through the sharing of advice and ideas, bringing like-minded people together and giving them a place to feel comfortable and communicate with others who share similar interests. We play an active role in promoting astronomy and ensuring that newcomers to the hobby get the right advice and make the right purchase when deciding on their first telescope.

With technological advances and improvement of techniques for astrophotography, IcelnSpace has been there to give astrophotographers a place to share their images, ask questions, offer and receive advice. This open sharing of information by our community is a cornerstone of the IcelnSpace spirit and has played a direct role in helping to lift the overall standard of astrophotography in Australia and our region.
